MONDERMAN. Q²-SODI™ · CROSS-LENS SYNTHESIS

Cross-Lens Synthesis Executive Report

Results across Diagnostics, showing where findings agree, where they differ and whether the evidence supports a combined score.

EXECUTIVE REPORT

Sample report · Example data

58 **CROSS-LENS COMPOSITE SCORE**

Mixed observed condition

Campaign checks recorded evidence

SAMPLE CREATED	PRODUCT	RUNS
September 14, 2026	Cross-Lens Synthesis	108
LENSES	**EVIDENCE**	
4	Campaign readiness checks satisfied	

Campaign status: Campaign readiness checks satisfied. This synthesis combines Structural Clarity (27), Operational Systems (27), Decision Velocity (27), Institutional Performance (27) and publishes an equal-lens composite condition of mixed observed condition. Two or more lens-level signals share the highest observed count, so the coherent read does not identify one unique dominant shared pattern. Use the lens summaries and contradictions to define a bounded validation question rather than forcing one causal diagnosis. The decision brief that follows includes a separate operational planning scenario, based on recorded activity and stated change assumptions. Diagnostic scores do not calculate its time or financial values.

> **INTERPRETATION BOUNDARY**
>
> This report is a directional cross-lens synthesis. A published composite is not a proven causal model; source evidence and alternative explanations remain necessary.

OPERATIONAL VALUE

Decision brief: three sources of value

Supplier onboarding improvement plan · 12 months

> All three benefit categories are covered. Summary and chart values are rounded. Detailed tables retain cents and fractional hours.

Central planning case

Lower current spending

$77,220

Potential change against the stated spending baseline

Example current expenses that can be reduced: duplicate external checks and paid overtime. Ordinary salaries remain unchanged.

Avoided future spending

$54,953

Potential change against the stated spending baseline

Example approved growth plan: added review support from month four and new external verification volume from month seven, without reducing required service.

Retained staff capacity

$260,404

2,478 retained hours; not cash savings

Illustrative 28-day operating records for 30 people. Distinct activity logs exclude external-service invoices.

Total cost, including internal staff time

$81,600

Net planning value

$310,977

Includes retained staff capacity; not a cash return.

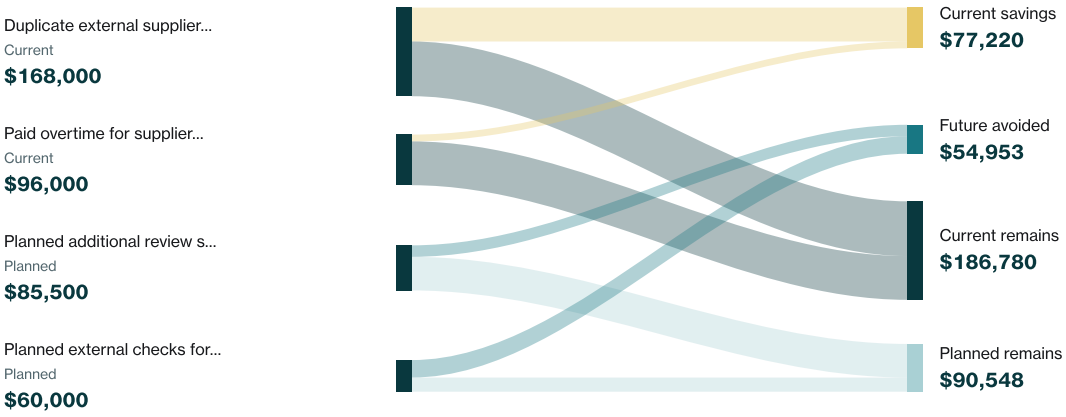

Central case: money and staff time

Two views of the proposed change, before costs. The baseline covers entered activities and expenses, not all organizational work or spending. Costs and net value are shown separately.

Money: current and planned spending

$409,500 current and planned expense baseline → **$277,328** remains; **$132,173** in potential spending benefits.

Baseline · 12 months **After the proposed changes**

Current savings and avoided future spending remain separate outcomes. Avoided spending is measured against documented plans, not a bank-balance increase. Salary-valued retained capacity is not included in this money chart.

Staff time: allocation and retained capacity

15,654 h recorded-work baseline → **12,784 h** remains; **2,870 h** could be released.

Baseline · 12 months **After the proposed changes**

Released time assigned to current or planned spending is excluded from time available for other work. Hours and dollars describe related effects; do not add them together.

Directional estimates based on collected self-reported sample data, recorded operational inputs and stated assumptions. Each diagram uses one unit and a fixed scale across Low, Central and High. Translucent ribbons reconcile minor rounding differences; the tables retain the saved values. Staff time is not automatically cash savings. Full item-by-item sources and assumptions follow in the report.

Three planning cases

Measure	Low	Central	High
Lower current spending	$54,720	$77,220	$101,400
Avoided future spending	$36,660	$54,952.5	$71,280
Retained staff capacity	$184,861.41	$260,404.29	$331,940.93
Retained staff hours	1,759.22	2,478.32	3,162.46
Cash investment	$68,600	$63,600	$58,600
Total cost including internal staff time	$92,600	$81,600	$70,600
Net current-spending effect	-$13,880	$13,620	$42,800
Net spending versus baseline	$22,780	$68,572.5	$114,080
Net planning value	$183,641.41	$310,976.79	$434,020.93
Entered benefit subtotal	$276,241.41	$392,576.79	$504,620.93
Entered subtotal less full cost	$183,641.41	$310,976.79	$434,020.93

Low pairs low benefit assumptions with high costs; high pairs high assumptions with low costs. Labor assigned to spending reductions is removed from retained capacity first, so retained capacity can be lower in a stronger spending case. These are planning cases, not confidence intervals or measured savings.

Interpretation and next steps

The saved Structural Clarity focus is unclear authority and ownership, and manager answers to those questions record meaningful overlap in responsibilities, decision rights depending on situation and pressure, and frequent time-consuming escalation when accountability is unclear; senior leaders answering differently worded questions record limits of authority mostly clear with occasional testing and unclear accountability occasionally escalated and clearly resolved. Managers also record that escalations are becoming normal and that timing is noticeably slower than the decision warrants. Next step: define one class of decisions and test a revised approval or escalation route for it, keeping required controls and confirming the reported condition against work records first.

Supporting evidence: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16. See the evidence register.

What the evidence shows

These findings distinguish scored results from what participants reported.

Across the Structural Clarity runs, the saved focus label is unclear authority and ownership, and the submitted scores fall into two separated groups: the senior leader mean sits well above both the manager and operational means, with the published median between them. These are within-sample scored responses for the submitted runs only, not a measure of how the work actually runs.

Supporting evidence: 1, 17, 2, 18, 19, 20, 21. See the evidence register.

Managers answering the Structural Clarity questions recorded that responsibilities overlap meaningfully in ways that create gaps or duplicated work, and that who can decide what depends on the situation and who applies pressure. On resolving unclear accountability, the recorded selection was that it is frequently escalated and takes time. Each of these describes answers to those exact questions from nine recorded answers, not observed events.

Supporting evidence: 7, 8, 9, 10, 11, 12. See the evidence register.

Senior leaders answering their own Structural Clarity questions recorded that limits of authority are mostly clear with occasional testing, that accountability usually transfers across boundaries with minor gaps, and that unclear accountability is occasionally escalated and clearly resolved. The wording of these questions differs from the manager set, so the contrast is between question-and-role pairs, not a proven disagreement about the same events.

Supporting evidence: 13, 14, 22, 23, 15, 16. See the evidence register.

In Operational Systems, managers recorded that workarounds vary noticeably from person to person, that a new joiner following only the documented process would need substantial coaching on how the work is really done, and that time on administrative maintenance is captured through informal estimates only with no routine records. These are recorded answers to those questions from nine responses each.

Supporting evidence: 24, 25, 26, 27, 28, 29. See the evidence register.

Managers answering the Decision Velocity questions recorded that escalations are becoming normal and that the process is noticeably slower than the decision warrants. Senior leaders answering their differently worded questions recorded that work bounces across too many roles or teams and that the process is slightly slower than the decision warrants.

Supporting evidence: 3, 4, 5, 6, 30, 31, 32, 33. See the evidence register.

What may explain it

Possible explanations to investigate, not established causes.

One manager account states that team members disagree about whether duplicate entry between the tracker and the vendor system is the main difficulty or whether unclear exceptions create most of the rework, and that the account covers both routine requests and exceptions. An operational account says that for a supplier exception, procurement and the requesting team sometimes each expect the other to decide, while a colleague considers the written responsibility table sufficient. It is possible that difficulty concentrates in exception cases rather than routine files, though one manager account also reports that ownership is clear in practice for some team members. A practical check is to pull a set of recent exception files and recent routine files and compare who actually decided each one.

Supporting evidence: 34, 35, 36. See the evidence register.

One operational account says that for an exception the same file is sometimes sent to several approvers with replies awaited in different places, while others on the team say a direct conversation is enough and the writer wants to confirm when the shorter route is authorized. A manager account says exceptions may wait between review meetings and that urgent decisions have also been completed promptly. A senior leader account reports that some managers describe the current route as clear and others describe repeated checks. Waiting might therefore relate to which approval an exception needs rather than to the route as a whole, and the accounts suggest separating urgent from routine cases before assuming a single cause. Reviewing recent exception cases to record which approval each was waiting for would test this.

Supporting evidence: 37, 38, 39. See the evidence register.

Practical next steps

Start with these practical checks or focused changes.

Next step 1

Write out each saved focus label beneath its own diagnostic, keeping unclear authority and ownership with Structural Clarity, administrative work with Operational Systems, approval and review requirements with Decision Velocity, and consistency and ability to respond to change with Institutional Performance, so that any follow-up review is scoped to one diagnostic at a time. Do not combine the labels into a single statement of the problem.

The four diagnostics each carry twenty-seven submitted runs under a verified question-set match, a common recorded work scope and an aligned time window, which makes side-by-side reading tempting. Similar wording across labels does not show one shared weakness, and keeping them separate prevents a follow-up review from chasing a merged problem that the saved results do not describe.

Supporting evidence: 40, 41, 42, 43, 44, 45, 46, 1, 17, 47, 48. See the evidence register.

Before trying it

Use only the selected runs and the saved comparison details in this report.

Risk to consider

Do not assume each run came from a different person, infer a cause, or apply the result beyond this submitted sample.

How to judge the change

Keep each label with its diagnostic and make no shared-focus, process or cause claim.

Three levels of change

These are alternatives, not a sequence or a presumption that a larger change is better. Check each option's prerequisites and risks.

Limited change

Review recent examples of one recurring decision and agree who can make it. Review one recurring delivery problem with the people responsible for the work. Follow one recurring task and identify a reported step or duplicate entry to investigate. Clarify who decides, who contributes and who carries out one recurring piece of work.

This scope matches the recorded manager answers that responsibilities overlap in ways creating gaps or duplicated work, that who decides depends on the situation and who applies pressure, and that workarounds vary from person to person. Whether those conditions apply to the particular decision or task chosen for review is unknown and would need checking against work examples.

Supporting evidence: 49, 50, 51, 2, 52, 53, 24, 25, 7, 8, 9, 10. See the evidence register.

Before trying it

Check the reported condition against specific work examples and confirm who owns the test.

Risk to consider

A local change may move work or risk elsewhere. Check its effects on the people receiving the work.

How to judge the change

Agree an observable measure before the change, review unintended effects and repeat the same diagnostic on a comparable scope and period.

Moderate change

Test a revised approval or escalation route for a defined class of decisions. Test a revised coordination and review routine for the affected work. Test a revised process for one recurring task, retaining required controls. Test a shared decision-and-handoff agreement in the affected team.

Managers recorded that escalations are becoming normal, that the process runs noticeably slower than the decision warrants, and that unclear accountability is frequently escalated and takes time to resolve. A bounded test of a revised route speaks to those recorded answers; it does not establish that the route is the cause, and the affected roles would need to agree the class of decisions first.

Supporting evidence: 49, 50, 51, 2, 52, 53, 3, 4, 5, 6, 11, 12. See the evidence register.

Before trying it

Confirm the reported problem in work records, agree the change with affected roles and retain required controls.

Risk to consider

A local change may move work or risk elsewhere. Check its effects on the people receiving the work.

How to judge the change

Agree an observable measure before the change, review unintended effects and repeat the same diagnostic on a comparable scope and period.

Structural change

Review decision authority and approval requirements across the affected units. Review the operating responsibilities and governance supporting delivery across the affected units. Review the ownership and design of the systems and controls supporting the affected work. Review the formal allocation of authority and accountability across the affected units.

The Structural Clarity runs split into two separated score groups, with the senior leader mean above the operational mean. That pattern marks where a wider review could look, but it is a within-sample difference that may reflect work scope or who submitted, so it is not by itself grounds for changing authority.

Supporting evidence: 49, 50, 51, 2, 52, 18, 20, 21, 53. See the evidence register.

Before trying it

Confirm the problem across affected roles and work records. Obtain the appropriate authority, assess risks and begin with a reversible test.

Risk to consider

Changing authority or controls can create new gaps. Do not implement an organization-wide change from diagnostic responses alone.

How to judge the change

Agree an observable measure before the change, review unintended effects and repeat the same diagnostic on a comparable scope and period.

RECOMMENDED PATH

Test a revised approval or escalation route for a defined class of decisions. Test a revised coordination and review routine for the affected work. Test a revised process for one recurring task, retaining required controls. Test a shared decision-and-handoff agreement in the affected team.

A bounded test on a defined class of decisions sits closest to what was actually recorded: managers reporting escalations becoming normal and timing noticeably slower than the decision warrants, senior leaders reporting slightly slower timing, and frequent escalation when accountability is unclear. It keeps required controls in place while the reported condition is checked against work records, rather than acting on the published synthesis score alone.

Supporting evidence: 49, 3, 4, 5, 6, 32, 33, 11, 12. See the evidence register.

This campaign met the evidence checks for a recommended path, with operating evidence and safeguards recorded by an authorized reviewer.

What this report cannot establish

This interpretation concerns the selected runs from this organization, not customers in other organizations.

The submitted sample may not represent the organization. Different scores can reflect different work, roles or sample composition.

No cause, time trend, sector percentile, prediction of performance or realized savings is established.

Comparisons across question-set versions can reflect changes in measurement. A withheld composite remains withheld.

Written observations, when supplied, are attributed participant accounts, not independently verified facts. A bounded role-and-lens selection may omit other written observations.

Answer summaries describe only recorded answers to each exact question, perspective, depth and question-set version in this campaign. Adaptive nonappearance is not an incomplete run. Withheld detail is not a favorable response. These distributions establish neither population prevalence, causation nor intervention eligibility.

9

Recorded answers: Decision Velocity / Senior leaders · 30-minute depth · Question-set 1.1.0 · 9 recorded answers · 9 matching saved reports

33. Given the type of decision being made, how reasonable is the time this process takes? · Recorded selection: Slightly slower than the decision warrants

9

34. Participant observation · Managerial

Participant's own experience: The tracker gives us a useful view of open supplier requests and the controls catch incomplete records. Keeping that tracker aligned with the vendor system creates extra work. Team members disagree about whether the duplicate entry is the main difficulty or whether unclear exceptions create most of the rework. My recent examples include both routine requests and exceptions.

35. Participant observation · Operational

Participant's own experience: The onboarding checklist is useful and I know who prepares each file. When a supplier needs an exception, procurement and the requesting team sometimes each expect the other to decide. I ask both before proceeding. A colleague says the written responsibility table is enough; that has not resolved the exceptions I have handled. My experience is mainly with routine requests.

36. Participant observation · Managerial

Participant's own experience: Routine suppliers usually have a clear owner and the checklist is followed. Exceptions are less clear: the requesting manager expects procurement to decide, while procurement sometimes sends the decision back. Some team members say ownership is clear in practice, so I would compare actual exception cases before changing responsibilities. My recent examples include both routine requests and exceptions.

37. Participant observation · Operational

Participant's own experience: Straightforward suppliers can move quickly once the documents are complete. For an exception I sometimes send the same file to several approvers and wait for replies in different places. Others on the team say a direct conversation is enough. I want to check when that shorter route is actually authorized. My experience is mainly with routine requests.

38. Participant observation · Managerial

Participant's own experience: The regular review meeting keeps most files moving. Exceptions may wait between meetings, and I sometimes seek confirmation from both procurement and the requesting manager. I have also seen urgent decisions completed promptly. I would separate urgent and routine examples before assuming the delay is the same for everyone. My recent examples include both routine requests and exceptions.

39. Participant observation · Senior Leader

Participant's own experience: Urgent supplier decisions generally reach me with a clear recommendation. Routine exceptions can take longer, and I do not always know which approval they are waiting for. Some managers report that the current route is clear; others describe repeated checks. I would inspect recent cases before removing an approval. My experience is mainly with the exceptions that are escalated.

Research and sector context

No newly checked public-source research is included. Any listed practice sources are dated references, not a current sector benchmark.

The reviewed sources do not supply a comparable sector distribution for this diagnostic. No sector percentile or numerical peer estimate is available.

1. About the Baldrige Excellence Framework · National Institute of Standards and Technology · Checked 2026-09-08

How Monderman produced this interpretation

Monderman's diagnostic engine produces the scores and determines which findings and recommendations the evidence supports. AI contributes research and explanation within those rules. Automated checks and a separate AI review check the interpretation against its supporting evidence before publication.

Prepared 2026-09-14T15:58:03.618Z. Report version monderman-interpretation-20260914.55. This report preserves the evidence and research used when it was prepared.

DIAGNOSTIC LENSES AT A GLANCE

Every Diagnostic receives one vote in the Composite. Submitted run counts affect evidence coverage, not lens weight; they do not establish how many distinct people responded. Connectors show composition, not causation.

01 · DIAGNOSTIC COMPARISON

Coherent cross-lens pattern

Two or more lens-level signals share the highest observed count, so the coherent read does not identify one unique dominant shared pattern. Use the lens summaries and contradictions to define a bounded validation question rather than forcing one causal diagnosis. The synthesis supports a bounded cross-lens interpretation, not a proven cause. Review the source runs, test alternative explanations, and use any intervention as a measured pilot.

SIGNALS APPEARING ACROSS DIAGNOSTICS

	STRUCTURAL CLARITY	OPERATIONAL SYSTEMS	DECISION VELOCITY	INSTITUTIONAL PERFORMANCE
Authority and routing Structural Clarity and Decision Velocity both indicate that authority boundaries and decision routing may be interacting. Review the source evidence to determine whether unclear ownership is slowing decisions, slow decisions are prompting added review, or both are local expressions of another condition.	●	·	●	·
Review and operating overhead Decision Velocity and Operational Systems both point to review activity and recurring administrative work. The shared signal warrants a pathway review, but the synthesis does not establish which condition precedes the other.	·	●	●	·
Burden and resilience Operational Systems and Institutional Performance both indicate that recurring operating burden and institutional resilience may be related. Test whether the same teams and workflows carry both signals before treating them as one mechanism.	·	●	·	●
Clarity and institutional consistency Structural Clarity and Institutional Performance both point toward readability and consistency of the organizational system. The overlap is a working hypothesis to validate against role, unit, and pathway evidence.	●	·	·	●
Mixed observed set Operational Systems shows moderate variation across 27 submitted runs. The central score should be read together with its distribution.	·	●	·	·

SIGNALS APPEARING IN MORE THAN ONE DIAGNOSTIC

Authority and routing. Structural Clarity and Decision Velocity both indicate that authority boundaries and decision routing may be interacting. Review the source evidence to determine whether unclear ownership is slowing decisions, slow decisions are prompting added review, or both are local expressions of another condition.

Review and operating overhead. Decision Velocity and Operational Systems both point to review activity and recurring administrative work. The shared signal warrants a pathway review, but the synthesis does not establish which condition precedes the other.

Burden and resilience. Operational Systems and Institutional Performance both indicate that recurring operating burden and institutional resilience may be related. Test whether the same teams and workflows carry both signals before treating them as one mechanism.

Filled marks show which Diagnostic evidence participates in each recurring signal. A signal appearing in more than one Diagnostic is a reason to investigate it across lenses; it does not establish a causal chain.

COMPOSITE CONDITION	HIGHEST MEAN	LOWEST MEAN	OBSERVED SPREAD
58	**Decision Velocity**	**Institutional Performance**	**18.7 pts**
Mixed observed condition	66.7 mean	48 mean	Campaign readiness checks satisfied

FIRST EVIDENCE-PROPORTIONATE MOVE

Validate the shared pattern

Select one bounded pathway and test the competing lens-level explanations rather than launching a broad multi-cause intervention.

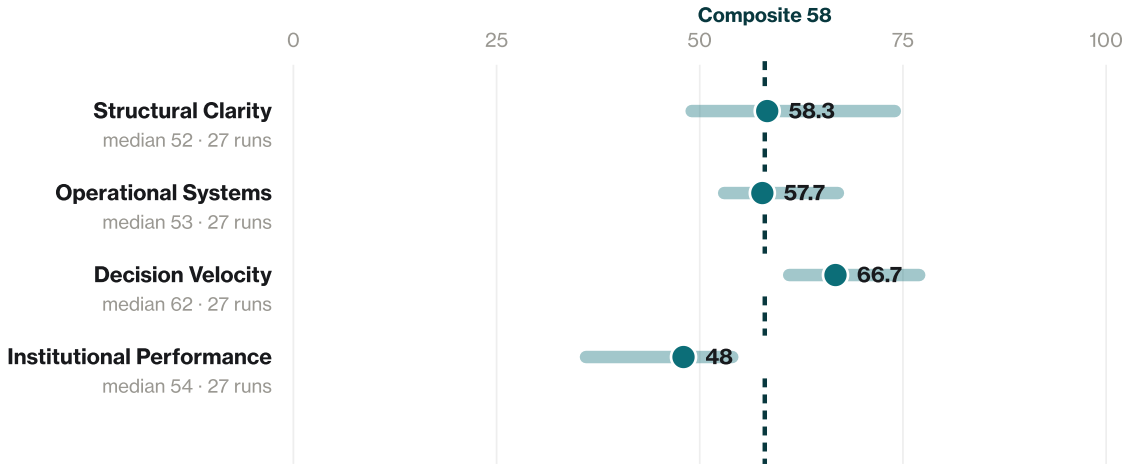

FROM FINDINGS TO ACTION

Check the work behind the result

Use the reported patterns to decide what to change. Any financial scenario requires separate operational records and explicit assumptions.

2. Contributing Diagnostic lenses

DIAGNOSTIC LENSES ON ONE SCALE

Dots are per-Diagnostic mean scores; horizontal marks show each lens IQR when available. The dashed Composite line is the equal-lens mean. Run count does not change a lens's weight in a published Composite score.

3. Executive synthesis

Coherent cross-lens pattern

Campaign Readiness Checks Satisfied · Directional Composite

Two or more lens-level signals share the highest observed count, so the coherent read does not identify one unique dominant shared pattern. Use the lens summaries and contradictions to define a bounded validation question rather than forcing one causal diagnosis. The synthesis supports a bounded cross-lens interpretation, not a proven cause. Review the source runs, test alternative explanations, and use any intervention as a measured pilot.

Campaign readiness checks satisfied: an equal-lens composite is published as mixed observed condition. A combined modeled time and labor-cost estimate is withheld because diagnostic scores, participant counts and medians do not establish organizational exposure, recoverable savings or return on investment. These estimates are withheld. A separate planning scenario requires explicit operational measurements and assumptions.

4 diagnostic lenses contribute to this read, with 108 runs in total and a 1:1 ratio between the largest and smallest submitted-run counts per Diagnostic. 4 cross-lens relationships are presented as working hypotheses, not causal findings. The server matched these included responses to one sponsor-declared work scope and period. Separate participant invitations and selected lens campaigns belong to that shared scope.

Use the composite as a directional summary, then return to the source lenses before acting. Validate the shared signal, test competing explanations, run a bounded pilot, and remeasure the same scope.

> **Score basis.** Arithmetic mean of the contributing lens means. Each diagnostic lens has equal weight. Recorded participant identities, declared population coverage and missing-score checks determine campaign readiness separately; they do not validate the composite scoring method.

4. Agreements and differences

CROSS-LENS EVIDENCE MAP

This map shows which submitted Diagnostic evidence participates in recurring signals. It organizes the evidence; it does not assert a causal pathway.

STRUCTURAL CLARITY	OPERATIONAL SYSTEMS	DECISION VELOCITY	INSTITUTIONAL PERFORMANCE
58.3	**57.7**	**66.7**	**48**
Structural Ambiguity	Operating Burden	Approval Density	Institutional Fragility

> **OBSERVED CROSS-LENS PATTERN**
>
> Two or more lens-level signals share the highest observed count, so the coherent read does not identify one unique dominant shared pattern. Use the lens summaries and contradictions to define a bounded validation question rather than forcing one causal diagnosis.

Authority and routing

Structural Clarity and Decision Velocity both indicate that authority boundaries and decision routing may be interacting. Review the source evidence to determine whether unclear ownership is slowing decisions, slow decisions are prompting added review, or both are local expressions of another condition.

Structural Clarity

Decision Velocity

Review and operating overhead

Decision Velocity and Operational Systems both point to review activity and recurring administrative work. The shared signal warrants a pathway review, but the synthesis does not establish which condition precedes the other.

Decision Velocity

Operational Systems

Burden and resilience

Operational Systems and Institutional Performance both indicate that recurring operating burden and institutional resilience may be related. Test whether the same teams and workflows carry both signals before treating them as one mechanism.

Operational Systems

Institutional Performance

Clarity and institutional consistency

Structural Clarity and Institutional Performance both point toward readability and consistency of the organizational system. The overlap is a working hypothesis to validate against role, unit, and pathway evidence.

Structural Clarity

Institutional Performance

Differences to keep visible

- Decision Velocity averages 67, while Institutional Performance averages 48 (19-point difference). This is a lens difference, not proof that one lens is masking or causing the other. Check scope, respondent mix, and source evidence before interpreting the gap.
- Decision Velocity contains two materially separated score groups (67% lower and 33% higher). The division should be mapped to units, roles, or pathways before the overall median is used as one shared organizational condition.

- The observed segment means differ by 16 points. This may reflect different local conditions, vantage effects, or sample composition and should be investigated before being treated as one shared condition.
- Structural Clarity contains two materially separated score groups (67% lower and 33% higher). The division should be mapped to units, roles, or pathways before the overall median is used as one shared organizational condition.
- The observed segment means differ by 25 points. This may reflect different local conditions, vantage effects, or sample composition and should be investigated before being treated as one shared condition.
- Institutional Performance contains two materially separated score groups (33% lower and 67% higher). The division should be mapped to units, roles, or pathways before the overall median is used as one shared organizational condition.
- The observed segment means differ by 18 points. This may reflect different local conditions, vantage effects, or sample composition and should be investigated before being treated as one shared condition.

5. Operational inputs and reconciliation

Each value comes from the saved scenario, not from a diagnostic score. Spending reductions use an existing expense baseline; avoided future spending uses a documented planned expense. Retained staff capacity excludes every hour assigned to either spending category.

The same measured activity and people over the stated period; no scaling to unmeasured staff.

Lower current spending

Example current expenses that can be reduced: duplicate external checks and paid overtime. Ordinary salaries remain unchanged. · Estimated

Avoided future spending

Example approved growth plan: added review support from month four and new external verification volume from month seven, without reducing required service. · Estimated

Retained staff capacity

Illustrative 28-day operating records for 30 people. Distinct activity logs exclude external-service invoices. · Estimated

Coordinating supplier exceptions

Measurement window	2026-08-16T04:05:34.496Z to 2026-09-13T04:05:34.496Z
People covered by records	30
Measured activity hours	700
Loaded hourly cost	$110
Source basis	Time Study
Source reference	Example time log EX-01: exception coordination, excluding repeated reviews
Proposed change	Give each supplier exception one decision owner and collect the required information before review. The example tests a 20–30% time reduction with 70–85% adoption; required checks remain.

Activity assumptions

Measure	Low	Central	High
Reduction assumption	20%	25%	30%
Adoption assumption	70%	80%	85%

Saved activity reconciliation

Measure	Low	Central	High
Gross hours freed	1,278.38	1,826.25	2,328.47
Hours assigned to current spending	96	162	228
Hours assigned to future spending	0	0	0
Retained staff hours	1,182.38	1,664.25	2,100.47
Retained capacity value	$130,061.25	$183,067.5	$231,051.56

Repeating internal document reviews

Measurement window	2026-08-16T04:05:34.496Z to 2026-09-13T04:05:34.496Z
People covered by records	30
Measured activity hours	500
Loaded hourly cost	$95
Source basis	Time Study
Source reference	Example time log RV-02: repeated internal reviews, excluding exception coordination
Proposed change	Use one completeness check and a shared record of completed reviews. The example tests a 15–25% time reduction with 70–85% adoption by avoiding repeated checks on unchanged documents.

Activity assumptions

Measure	Low	Central	High
Reduction assumption	15%	20%	25%
Adoption assumption	70%	80%	85%

Saved activity reconciliation

Measure	Low	Central	High
Gross hours freed	684.84	1,043.57	1,385.99
Hours assigned to current spending	0	0	0
Hours assigned to future spending	108	229.5	324
Retained staff hours	576.84	814.07	1,061.99
Retained capacity value	$54,800.16	$77,336.79	$100,889.36

Duplicate external supplier checks

Benefit category	Lower current spending
Resource reference	expense-current-checks
Expense type	Non Labor
Baseline each month	40 checks
Cost per unit	$350
Active planning months	1 to 12 (12 months)
Linked capacity activity	Not applicable: non-labor expense
Source reference	Example invoice baseline CH-01: 40 duplicate checks each month at $350 each
Proposed change	Reuse a valid completed external check instead of commissioning it again. Confirm contractual cancellation rights and retain all mandatory checks.

Spending assumptions

Measure	Low	Central	High
Reduction assumption	35%	45%	55%
Adoption assumption	80%	85%	90%

Saved spending benefit

Measure	Low	Central	High
Spending benefit	$47,040	$64,260	$83,160
Capacity hours assigned to this expense	0	0	0

Paid overtime for supplier exceptions

Benefit category	Lower current spending
Resource reference	expense-current-overtime
Expense type	Labor
Baseline each month	100 hours
Cost per unit	$80
Active planning months	1 to 12 (12 months)
Linked capacity activity	exception-coordination
Source reference	Example payroll baseline OT-02: 100 paid overtime hours each month at $80 per hour
Proposed change	Use released exception-coordination hours to reduce paid overtime. These hours are deducted from capacity available for other work.

Spending assumptions

Measure	Low	Central	High
Reduction assumption	10%	15%	20%
Adoption assumption	80%	90%	95%

Saved spending benefit

Measure	Low	Central	High
Spending benefit	$7,680	$12,960	$18,240
Capacity hours assigned to this expense	96	162	228

Planned additional review support

Benefit category	Avoided future spending
Resource reference	expense-planned-review-support
Expense type	Labor
Baseline each month	100 hours
Cost per unit	$95
Active planning months	4 to 12 (9 months)
Linked capacity activity	repeated-reviews
Source reference	Example approved plan GR-03: 100 additional review-support hours per month from month four at $95 per hour
Proposed change	Use part of the time released from repeated reviews to absorb the planned work. Reduce only the planned hours replaced by that capacity, not an entire hire.

Spending assumptions

Measure	Low	Central	High
Reduction assumption	15%	30%	40%
Adoption assumption	80%	85%	90%

Saved spending benefit

Measure	Low	Central	High
Spending benefit	$10,260	$21,802.5	$30,780
Capacity hours assigned to this expense	108	229.5	324

Planned external checks for new suppliers

Benefit category	Avoided future spending
Resource reference	expense-planned-growth-checks
Expense type	Non Labor
Baseline each month	20 checks
Cost per unit	$500
Active planning months	7 to 12 (6 months)
Linked capacity activity	Not applicable: non-labor expense
Source reference	Example approved growth budget GR-04: 20 new supplier checks per month from month seven at $500 each, separate from existing duplicate checks
Proposed change	Use accepted shared verification for eligible new suppliers instead of purchasing another check. This planned volume is not included in the current-expense baseline.

Spending assumptions

Measure	Low	Central	High
Reduction assumption	55%	65%	75%
Adoption assumption	80%	85%	90%

Saved spending benefit

Measure	Low	Central	High
Spending benefit	$26,400	$33,150	$40,500
Capacity hours assigned to this expense	0	0	0

Month-by-month capacity allocation

Identical consecutive months are shown together. Each row still shows one month, not the total for that month range.

Coordinating supplier exceptions

Months 1 to 12 - hours in each month

Measure	Low	Central	High
Gross hours freed	106.53	152.19	194.04
Assigned to current spending	8	13.5	19
Assigned to future spending	0	0	0
Retained capacity hours	98.53	138.69	175.04

Repeating internal document reviews

Months 1 to 3 - hours in each month

Measure	Low	Central	High
Gross hours freed	57.07	86.96	115.5
Assigned to current spending	0	0	0
Assigned to future spending	0	0	0
Retained capacity hours	57.07	86.96	115.5

Months 4 to 12 - hours in each month

Measure	Low	Central	High
Gross hours freed	57.07	86.96	115.5
Assigned to current spending	0	0	0
Assigned to future spending	12	25.5	36
Retained capacity hours	45.07	61.46	79.5

Paid overtime for supplier exceptions - allocated capacity

Months 1 to 12 - hours in each month

Measure	Low	Central	High
Hours allocated to this expense	8	13.5	19

Planned additional review support - allocated capacity

Months 4 to 12 - hours in each month

Measure	Low	Central	High
Hours allocated to this expense	12	25.5	36

Implementation and subscription

Cost input ranges (lower to higher costs)

Measure	Low	Central	High
Implementation cash	$10,000	$15,000	$20,000
Internal implementation capacity	$12,000	$18,000	$24,000

Subscription allocation: $48,600

Illustrative 12-month Pattern allocation: $48,600 paid annually in advance ($54,000 if paid in installments). External support is incremental cash; internal staff time is separate capacity cost. No costs are counted twice. This is an example assumption, not a customer quotation.

Gross recovered activity hours are spread evenly across the planning months. Labor expense benefits allocate hours only in their stated active months. Current and future expense allocations share the same capacity limit each month.

Campaign participation checks are satisfied. They do not establish financial accuracy.

The three benefit categories are assessed separately. Missing estimates are not zero; partial subtotals include only entered categories.

Low, central and high are sensitivity cases, not probabilities or confidence intervals; retained capacity values need not be in increasing order.

The planning period assumes measured activity volume continues, with capacity spread evenly across months. Review seasonality and planned changes.

Existing-spend reductions and future-spend avoidance require different baselines. A future spending plan is a customer-declared counterfactual.

Resource identities and overlap attestations require customer review; the source records have not been independently audited.

Use actual implementation and operating results to update the scenario; a favorable calculation is not proof of effectiveness.

6. Results by participant perspective

Operational

Results from the Operational perspective: Structural Clarity: 9 recorded participants, mean 49, median 49; Operational Systems: 9 recorded participants, mean 53, median 53; Decision Velocity: 9 recorded participants, mean 62, median 62; Institutional Performance: 9 recorded participants, mean 54, median 54. These are recorded account or invitation identities, not independently verified physical people. This section reports scores only. Campaign status: Campaign readiness checks satisfied.

Managerial

Results from the Managerial perspective: Structural Clarity: 9 recorded participants, mean 52, median 52; Operational Systems: 9 recorded participants, mean 53, median 53; Decision Velocity: 9 recorded participants, mean 61, median 61; Institutional Performance: 9 recorded participants, mean 54, median 54. These are recorded account or invitation identities, not independently verified physical people. This section reports scores only. Campaign status: Campaign readiness checks satisfied.

Senior Leader

Results from the Senior Leader perspective: Structural Clarity: 9 recorded participants, mean 74, median 74; Operational Systems: 9 recorded participants, mean 67, median 67; Decision Velocity: 9 recorded participants, mean 77, median 77; Institutional Performance: 9 recorded participants, mean 36, median 36. These are recorded account or invitation identities, not independently verified physical people. This section reports scores only. Campaign status: Campaign readiness checks satisfied.

This section reports recorded group statistics. Authorized written accounts, when included, are presented separately and do not affect scores.

7. Evidence in this run

> **Campaign readiness checks satisfied.** The declared scope, recorded participant identities, instrument versions, group coverage and bounded missing-score checks meet the current campaign policy. This does not establish measurement validity, a cause or an effective intervention.

Each recorded participant identity is counted once across the selected lens campaigns. Account and invitation records are not independent proof of unique physical people or of the declared population.

Campaign readiness checks the declared population, compatible measurements and the possible effect of missing responses. Passing these checks is not scientific validation or a probability of accuracy.

EVIDENCE STRENGTH

Campaign readiness checks satisfied

CROSS-LENS COMPOSITE SCORE

Published

Arithmetic mean of the contributing lens means. Each diagnostic lens has equal weight. Recorded participant identities, declared population coverage and missing-score checks determine campaign readiness separately; they do not validate the composite scoring method.

SCOPE

Recorded campaign scope

The server matched these included responses to one sponsor-declared work scope and period. Separate participant invitations and selected lens campaigns belong to that shared scope.

RUN-COUNT BALANCE ACROSS DIAGNOSTICS

Reported Not Validated

Largest-to-smallest submitted-run count ratio: 1:1

QUESTION-SET AND SCORING VERSIONS

Instrument versions aligned

IDENTIFIERS FOR SUBMITTED RUNS

Verified

Every submitted result carries a unique source-run identifier.

MEASUREMENT WINDOW

Aligned

Every included response falls within the same sponsor-declared measurement period. Time alignment alone does not show that conditions remained unchanged.

REPRESENTATIVENESS

Recorded participation in a declared population

Distinct account or invitation identities are counted within the sponsor-declared population. This is not independent proof of unique physical people, a representative sample or an accurate population declaration.

8. Method and limits

This campaign uses its recorded population, participant identities, measurement versions and period. Readiness checks whether missing responses could move the population median into a different existing score band. These are conservative product rules, not an independently validated scientific threshold. When the campaign and coherence checks permit a Composite, each contributing diagnostic mean receives equal weight. This scoring rule is not an empirically validated causal model. Differences remain visible. A preferred action additionally requires a recorded operating-evidence and safeguards review; eligibility does not prove an intervention will work.

Participation and missing-response reporting are informed by selected published AAPOR guidance. Monderman defines its own eligibility rules; AAPOR has not validated them.

> **Organizational implication.** The cross-lens pattern is coherent enough for a directional composite, but it is not a proven causal model. The organization should validate the shared signal against the source runs and test alternatives before intervention design.

> **INTERPRETATION BOUNDARY**
>
> This report is a directional cross-lens synthesis. A published composite is not a proven causal model; source evidence and alternative explanations remain necessary.
