

Decision Velocity: Executive Report

What this run measured, what the result may mean, what remains uncertain, and what to test next.

EXECUTIVE REPORT

Sample report · Example data

72 **DIAGNOSTIC SCORE**
Compounding

SAMPLE CREATED	INSTRUMENT	SCOPE
September 13, 2026	Decision Velocity	Operations

Main measured focus for Supplier onboarding: Decisions referred to a higher level.

Interpretation and next steps

This participant reports a process that is noticeably slower than the decision warrants, with the most delay near final approval or sign-off. Escalations becoming normal was recorded as the most common source of excess time or oversight. The suggested next steps are personal reviews of single available cases: what remains outstanding at that sign-off point, and why one decision was referred elsewhere.

Supporting evidence: 1, 2, 3. See the evidence register.

Important context from the saved result

- Not measured: Coordination. No score is available for this dimension. Related answers may still be reported separately.

What the evidence shows

These findings distinguish scored results from what participants reported.

This participant estimates an average of 14 calendar days from a decision request first entering the process to the final decision, counting time waiting at intake, in queues and between reviews. The same participant estimates that a typical decision requires 4 separate approvals, reports that some approvals happen at the same time while others happen one after another, and reports that the most delay occurs near final approval or sign-off.

Supporting evidence: 4, 3, 5, 6. See the evidence register.

Asked for the most common source of excess time or oversight in this process, the participant answered that escalations are becoming normal. Separately, referral to a higher level than the formal process requires was reported as happening sometimes, oversight requirements over the past year as about the same, and the time the process takes as noticeably slower than the decision warrants. The scored responses fall in the Compounding band, which classifies scored answers only.

Supporting evidence: 7, 1, 2, 8, 9. See the evidence register.

Reported experience

Senior leaders · Decision Velocity

Scope: This participant's reported work

"Participant's own experience: Urgent supplier decisions generally reach me with a clear recommendation. Routine exceptions can take longer, and I do not always know which approval they are waiting for. Some managers report that the current route is clear; others describe repeated checks. I would inspect recent cases before removing an approval. My recent examples include both routine requests and exceptions."

Worth checking with the managers involved: for a routine exception that is waiting, can the specific approval it is waiting for be identified at that moment, and by whom?

Supporting evidence: 10. See the evidence register.

Practical next steps

Start with these practical checks or focused changes.

For all next steps

Before trying it

Obtain permission and access before the review. If either is unavailable, stop. Process changes need separate approval.

Risk to consider

An isolated example may not represent normal work; do not generalize its findings.

Next step 1

If a decision example at the reported delay point is available, review it to identify the requirements that remain before final approval or sign-off.

The participant reports that the most delay occurs near final approval or sign-off, and also reports several separate approvals arranged partly at the same time and partly one after another. A single available case can show what is actually outstanding at that point rather than assuming the sign-off itself is unnecessary.

Supporting evidence: 3, 5, 6. See the evidence register.

How to judge the test

Record the requirements remaining before final approval or sign-off at the reviewed delay point. Note anything unresolved or contrary to the concern.

Next step 2

If a relevant decision example is available, review it to establish why it was referred elsewhere and whether the referral followed the formal route.

This participant named escalations becoming normal as the most common source of excess time or oversight, reported referral above the formal level as happening sometimes, and said they would inspect recent cases before removing an approval. Reviewed federal internal control guidance supports examining a control against the risk it addresses; applying it outside government is a proposal, not a compliance conclusion.

Supporting evidence: 1, 9, 10. See the evidence register. Practice sources: 1. See Research and sector context.

How to judge the test

Record the reason for the referral and whether it followed the formal route. Note anything unresolved or contrary to the concern.

What this report cannot establish

Responses describe one participant's view. More questions do not establish greater validity.

Missing evidence is unknown, not a favorable result.

Scores do not establish causation, predict later performance or prove realized savings.

Organizational exposure, projected recovery and return on investment are withheld for a single run. A participant's recorded time answer is not organizational savings.

Instrument design-reference ranges are not empirical sector benchmarks.

Names may remain in participant text after best-effort minimization. Observations about other roles remain this participant's account.

Supporting evidence register

Each item is listed once. Numbers beside findings and actions refer to these saved values or attributed observations.

1. What is the most common source of excess time or oversight in this decision process?

Escalations are becoming normal

2. Given the type of decision being made, how reasonable is the time this process takes?

Noticeably slower than the decision warrants

3. Where does the most delay occur in this process?

Near final approval or sign-off

4. On average, how many calendar days pass from when a decision request first enters this process to the final decision? Include time waiting at intake, in queues, and between reviews, not just time spent actively working on it.

14

5. How many separate approvals does a typical decision in this process require?

4

6. How are the approvals in this process usually organized?

Some approvals happen at the same time; others happen one after another.

7. Result band

Compounding

8. Over the past year, have the oversight requirements on this process increased, decreased, or stayed about the same?

About the same

9. How often is a decision in this process referred to a higher level than the formal process requires?

Sometimes

10. Participant observation · Senior Leader

Participant's own experience: Urgent supplier decisions generally reach me with a clear recommendation. Routine exceptions can take longer, and I do not always know which approval they are waiting for. Some managers report that the current route is clear; others describe repeated checks. I would inspect recent cases before removing an approval. My recent examples include both routine requests and exceptions.

Research and sector context

No newly checked public-source research is included. Any listed practice sources are dated references, not a current sector benchmark.

The reviewed sources do not supply a comparable sector distribution for this diagnostic. No sector percentile or numerical peer estimate is available.

How Monderman produced this interpretation

Monderman's diagnostic engine produces the scores and determines which findings and recommendations the evidence supports. AI contributes research and explanation within those rules. Automated checks and a separate AI review check the interpretation against its supporting evidence before publication.

Prepared 2026-09-13T21:09:48.873Z. Report version monderman-interpretation-20260913.38. This report preserves the evidence and research used when it was prepared.

Main measured focus for Supplier onboarding: Decisions referred to a higher level.

DIAGNOSTIC SCORE

72

COMPOUNDING

This decision process received a score of 72 in the compounding band. The measured sources of delay are concentrated, and Escalation dependence is the largest.

PRIMARY MEASURED FOCUS	PARTICIPANT PERSPECTIVE	CHANGE OVER TIME	EVIDENCE DEPTH
Decisions referred to a higher level The submitted answers place escalation at the largest share of measured pathway burden. Whether decision-right clarity contributes requires a separate test.	Senior Leader One person's recorded view	Not established by this run	Narrow, first signal Senior Leader perspective

WHAT THIS MAY MEAN

Start with one small test of Escalation dependence. Measure the time and whether the process remains reliable.

Dimension profile

The profile keeps the total score and its contributing dimensions visible together. For condition dimensions, lower values indicate greater measured constraint. For Compensatory Effort, when shown, higher values indicate more reported extra effort.

WHERE THE MEASURED ISSUE APPEARS

PATTERN ACROSS DIMENSIONS

Concentrated

The submitted answers place escalation at the largest share of measured pathway burden. Whether decision-right clarity contributes requires a separate test.

What the result supports and what it does not

DESIGN REFERENCE (NOT A PEER BENCHMARK)

This decision process sits on the middle of the instrument's design reference for professional services. The reference comes from the instrument's design, not customer or industry data. Use the score, measured dimensions, and submitted operating evidence when deciding what to do. Elapsed time is the participant's estimate of calendar days from first request entry to the final decision, including waiting at intake, in queues, and between reviews; it is not active working time.

TRADEOFF TO CONSIDER

Some delay may protect risk, quality, or legitimacy. Test whether the time added by review is justified by the decision and the risk.

RELATIONSHIP BETWEEN THE MEASURED DIMENSIONS

This placement combines relatively stronger execution responsiveness with lighter governance weight. It is structurally favorable on these two axes, but it does not by itself establish a healthy pathway: coordination load, execution stability, and the overall score still govern the condition read. The recorded score band is Compounding. Use the dimension profile to select a bounded check; the band does not establish cause or a required intervention.

CHANGE OVER TIME

Not established by this run

What this result is based on

EVIDENCE DEPTH	MEASURED DIMENSIONS	PERSPECTIVE
Narrow, first signal Scope of this single run	3 of 4 Dimensions represented	Senior Leader Notes do not change the score

SENIOR LEADER

Urgent supplier decisions generally reach me with a clear recommendation. Routine exceptions can take longer, and I do not always know which approval they are waiting for. Some managers report that the current route is clear; others describe repeated checks. I would inspect recent cases before removing an approval. My recent examples include both routine requests and exceptions.

WHAT TO WATCH NEXT

- No major contradiction signals surfaced in this run.

The score and dimension values come from the submitted answers. Participant notes, when present, are shown separately and do not change the score. One run does not establish organizational savings or recoverable time. The design reference was set when the instrument was designed; it is not a comparison with customer or industry data.

INTERPRETATION BOUNDARY

This report is based on one participant's answers for the stated scope. It suggests issues to investigate and changes to test. It does not show how common these conditions are, prove their causes or predict performance. Organizational time and money estimates require separate operational measurements beyond a single run.
